March 2021 Southwest Climate Outlook

Monthly Precipitation and Temperature: February precipitation was mostly below average to record driest in Arizona and near average across most of New Mexico (Fig. 1a). February temperatures ranged between average and above average in most of Arizona and between average and below average in most of New Mexico (Fig. 1b).

Winter Precipitation and Temperature: Dec-Feb Precipitation ranks were average to below average across most of the Southwest, with a few pockets of much below average (Fig. 2a). Temperature ranks for the same period were average to above average across most of Arizona, and mostly average in New Mexico, with some pockets of both above and below average (Fig. 2b). Precipitation totals from stations around the region demonstrate the below normal precipitation conditions this winter (Fig. 3).

Drought: Water year precipitation to date (as of Feb 28, 2021) reveals widespread below normal and much below normal conditions across the Southwest, along with a large cluster of record driest in the CA/NV/AZ region (Fig. 4). The U.S. Drought Monitor (USDM) is mostly unchanged over the last month in the U.S. Southwest (Fig. 5). This is partly because much of the region is at the highest drought category (D4, Exceptional Drought): In Arizona and New Mexico, over 50-percent of the region is in D4, and over 80-percent is in at least D3 (Extreme Drought).

Snowpack and Water Supply: Snow water equivalent (SWE) is well below the 1981-2010 median for much of the region (see the NRCS website for details). Streamflow forecasts reflect this reality and are well below median across most of the Southwest (Fig. 6). Most of the reservoirs in the region are at or below the values recorded at this time last year. Most are below their long-term average (see Arizona and New Mexico reservoir storage on p. 5).

ENSO Tracker: La Niña conditions are present and are expected to continue through spring (see ENSO-tracker on p. 3 for details). Despite some winter storm activity (including some impressive snow totals), the expectation remains for cumulative cool season precipitation totals to be below average for much of the Southwest.

Precipitation and Temperature Forecast: The three-month outlook for Apr through Jun calls for increased chances for below-normal precipitation across most of the southwestern U.S., with a swath of increased chances of above-normal precipitation extending from central Mexico into southeastern Arizona (Fig. 7, top). The three-month temperature outlook calls for increased chances of above-normal temperatures across the southwestern U.S. and northern Mexico (Fig. 7, bottom).

Figure 5: US Drought Monitor - Mar 2, 2021

Figure 6: Mar 1 Streamflow Forecast Percent of Median (50% Exceedence Prob.)
Sea surface temperature (SST) anomaly forecasts point to normal or slightly below normal conditions across much of the equatorial Pacific (Fig. 1). The current anomalies show a similar pattern, as they continue to move towards neutral conditions (Fig. 2). International climate outlooks reflect this trend, and see La Niña conditions waning along with winter, and returning to ENSO-neutral conditions over spring 2021.

**Forecast Roundup:** On Mar 10, the Japanese Meteorological Agency (JMA) maintained its observation of an ongoing La Niña, with an 80-percent chance that conditions “will fade into ENSO-neutral” by spring. On Mar 11, the NOAA Climate Prediction Center (CPC) ENSO status was at La Niña Advisory. The CPC called for a 60-percent chance of a transition to ENSO-neutral during spring. On Mar 11, the International Research Institute (IRI) issued an ENSO Quick Look (Fig. 3), noting “most key atmospheric variables are consistent with continued La Niña conditions.” On Mar 16, the Australian Bureau of Meteorology was at official La Niña status, but stated “La Niña is nearing its end.” They highlighted neutral oceanic conditions, and “a number of atmospheric indicators (that) remain at La Niña levels.” They emphasized this could cause La Niña precipitation patterns to stick around a little longer. The North American Multi-Model Ensemble (solid and dashed black line, Fig. 4) indicates La Niña conditions are expected to return to ENSO-neutral conditions over the next few months.

**Summary:** La Niña conditions are present and should remain in place through spring. The monthly and seasonal climate outlooks reflect these conditions, with forecasts of mostly drier than normal conditions in the Southwest over the same period. Storm activity in the Southwest (including heavy snow) means this La Niña feels less extreme compared to years with nearly zero winter precipitation. Despite these events, this winter is following an expected pattern with less frequent precipitation events and lower seasonal totals compared to normal (see Fig. 3 on p 2). There are exceptions, but this is a pretty robust and predictable outcome in the U.S. Southwest for La Niña.

# Reservoir Volumes

**DATA THROUGH MAR 1, 2021**

**Data Source:** National Water and Climate Center, Natural Resources Conservation Service

The map gives a representation of current storage for reservoirs in Arizona and New Mexico. Reservoir locations are numbered within the blue circles on the map, corresponding to the reservoirs listed in the table. The cup next to each reservoir shows the current storage (blue fill) as a percent of total capacity. Note that while the size of each cup varies with the size of the reservoir, these are representational and not to scale. Each cup also represents last year’s storage (dotted line) and the 1981–2010 reservoir average (red line).

The table details more exactly the current storage (listed as a percent of maximum capacity). Current and maximum storage are given in thousands of acre-feet for each reservoir. One acre-foot is the volume of water sufficient to cover an acre of land to a depth of 1 foot (approximately 325,851 gallons). On average, 1 acre-foot of water is enough to meet the demands of four people for a year. The last column of the table lists an increase or decrease in storage since last month. A line indicates no change.

These data are based on reservoir reports updated monthly by the National Water and Climate Center of the U.S. Department of Agriculture’s Natural Resources Conservation Service (NRCS).

The Southwest Climate Podcast

Feb 2021 Southwest Climate Podcast - Recent Storms and Dry Forecasts - Diving into La Niña and 2021

In the February 2021 episode of the CLIMAS Southwest Climate Podcast, Mike Crimmins and Zack Guido jump back into discussing winter conditions in the Southwest. This includes what happened so far in 2021 with a few runs of storms that affected parts of Arizona and New Mexico. This also includes the role that La Niña may be playing this winter (snowpack, streamflow forecasts, rain/snow events, etc.), and how this compares to previous winters and La Niña events. They also discuss what we might expect over the rest of the winter and into early spring (Feb-Mar).

https://bit.ly/3prODAt

Previous Episodes

Dec 2020 - Tracking Drought Conditions, La Niña Forecasts, and What 2021 Might Bring

In the December edition of the CLIMAS Southwest Climate Podcast, Mike Crimmins and Zack Guido sit down to discuss drought, La Nina, and what to expect (or at least hope for) in 2021. First, they recap the event that swept through on Dec 9-11, to talk through how different locations in the region fared in terms of precip. Next, they transition into the drought situation, which is currently looking pretty dire for the region - and discuss ‘just how much worse can it get’ - given much of the region is at Exceptional Drought (D4, the highest category on the US Drought Monitor), looking to some past events for comparison. They wrap things up with some 2021 predictions - things they think could (or hope might) happen in 2021.

Nov 2020 - Unprecedented or Uncommon, A La Niña Winter after a Failed Monsoon

In the November episode of the CLIMAS Southwest Climate Podcast, Mike Crimmins and Zack Guido sit down to discuss weather and climate in the Southwest, including what we might expect over the next few months. They discuss La Niña and what this might mean for the Southwest, including implications of La Niña following a much drier than average monsoon and what the historical record says about just how unprecedented this pattern might be (dry monsoon, dry winter). Finally, they take a closer look at fire, and how the season has progressed in the Southwest, given the lack of rain, and what we might watch for going into next year’s fire season.

We also finally have podcast gear (shirts and mugs).

Prices are the wholesale cost, so we don’t make any money, but if you are interested in showing your support - or enjoying the (lack of a) monsoon in style, this is one way to do so.
The Climate Assessment for the Southwest (CLIMAS) program was established in 1998 as part of the National Oceanic and Atmospheric Administration’s Regional Integrated Sciences and Assessments program. CLIMAS—housed at the University of Arizona’s Institute of the Environment—is a collaboration between the University of Arizona and New Mexico State University. The CLIMAS team is made up of experts from a variety of social, physical, and natural sciences who work with partners across the Southwest to develop sustainable answers to regional climate challenges.

What does CLIMAS do?

The CLIMAS team and its partners work to improve the ability of the region’s social and ecological systems to respond to and thrive in a variable and changing climate. The program promotes collaborative research involving scientists, decision makers, resource managers and users, educators, and others who need more and better information about climate and its impacts. Current CLIMAS work falls into six closely related areas: 1) decision-relevant questions about the physical climate of the region; 2) planning for regional water sustainability in the face of persistent drought and warming; 3) the effects of climate on human health; 4) economic trade-offs and opportunities that arise from the impacts of climate on water security in a warming and drying Southwest; 5) building adaptive capacity in socially vulnerable populations; and 6) regional climate service options to support communities working to adapt to climate change.
